Subject: May Update from Fabre Minerals

The Sainte-Marie-aux-Mines Mineral Show is coming, but we continue publishing our updates. In this new one, we particularly highlight 6 Kermesite specimens from China, notable for their quality as well as the fact that this material disappeared from the mineral market some years ago. Along with these, there are a number of extraordinary specimens, such as a Legrandite, exceptional not only for its quality but also to come from the type locality for the species. Also in the update several high level specimens as the Copper from Itauz, a "Saramenha" Topaz from Brazil, an alpine "gwindel" Quartz, among other high quality minerals. Rounding out the update two Spanish suites. One, Fluorite from La Viesca-La Collada and the other, iridescent Goethite from Tharsis.

To see them use this link:

We would remind you that, among our updates, we publish the "Mineral Express" updates, without previous mailing announce, like the last Mineral Express update with the new Aurichalcites from Troya Mine Quarry:
